"… React.PureComponent implements (…) a shallow prop and state comparison."

```
// A simple implementation of the shallowCompare.
// only compares the first level properties and hence shallow.
// state updates(theoretically) if this function returns true.
function shallowCompare(newObj, prevObj){
  for (key in newObj) {
      if (newObj[key] !== prevObj[key]) return true;
  }

  return false;
}
```
